# Road Map

- HEPATITIS DELTA VIRUS EPIDEMIOLOGY IN PEOPLE LIVING WITH HIV
- GENERAL THERAPY CONSIDERATIONS
- BULIVERTIDE IN HIV/HBV/HDV

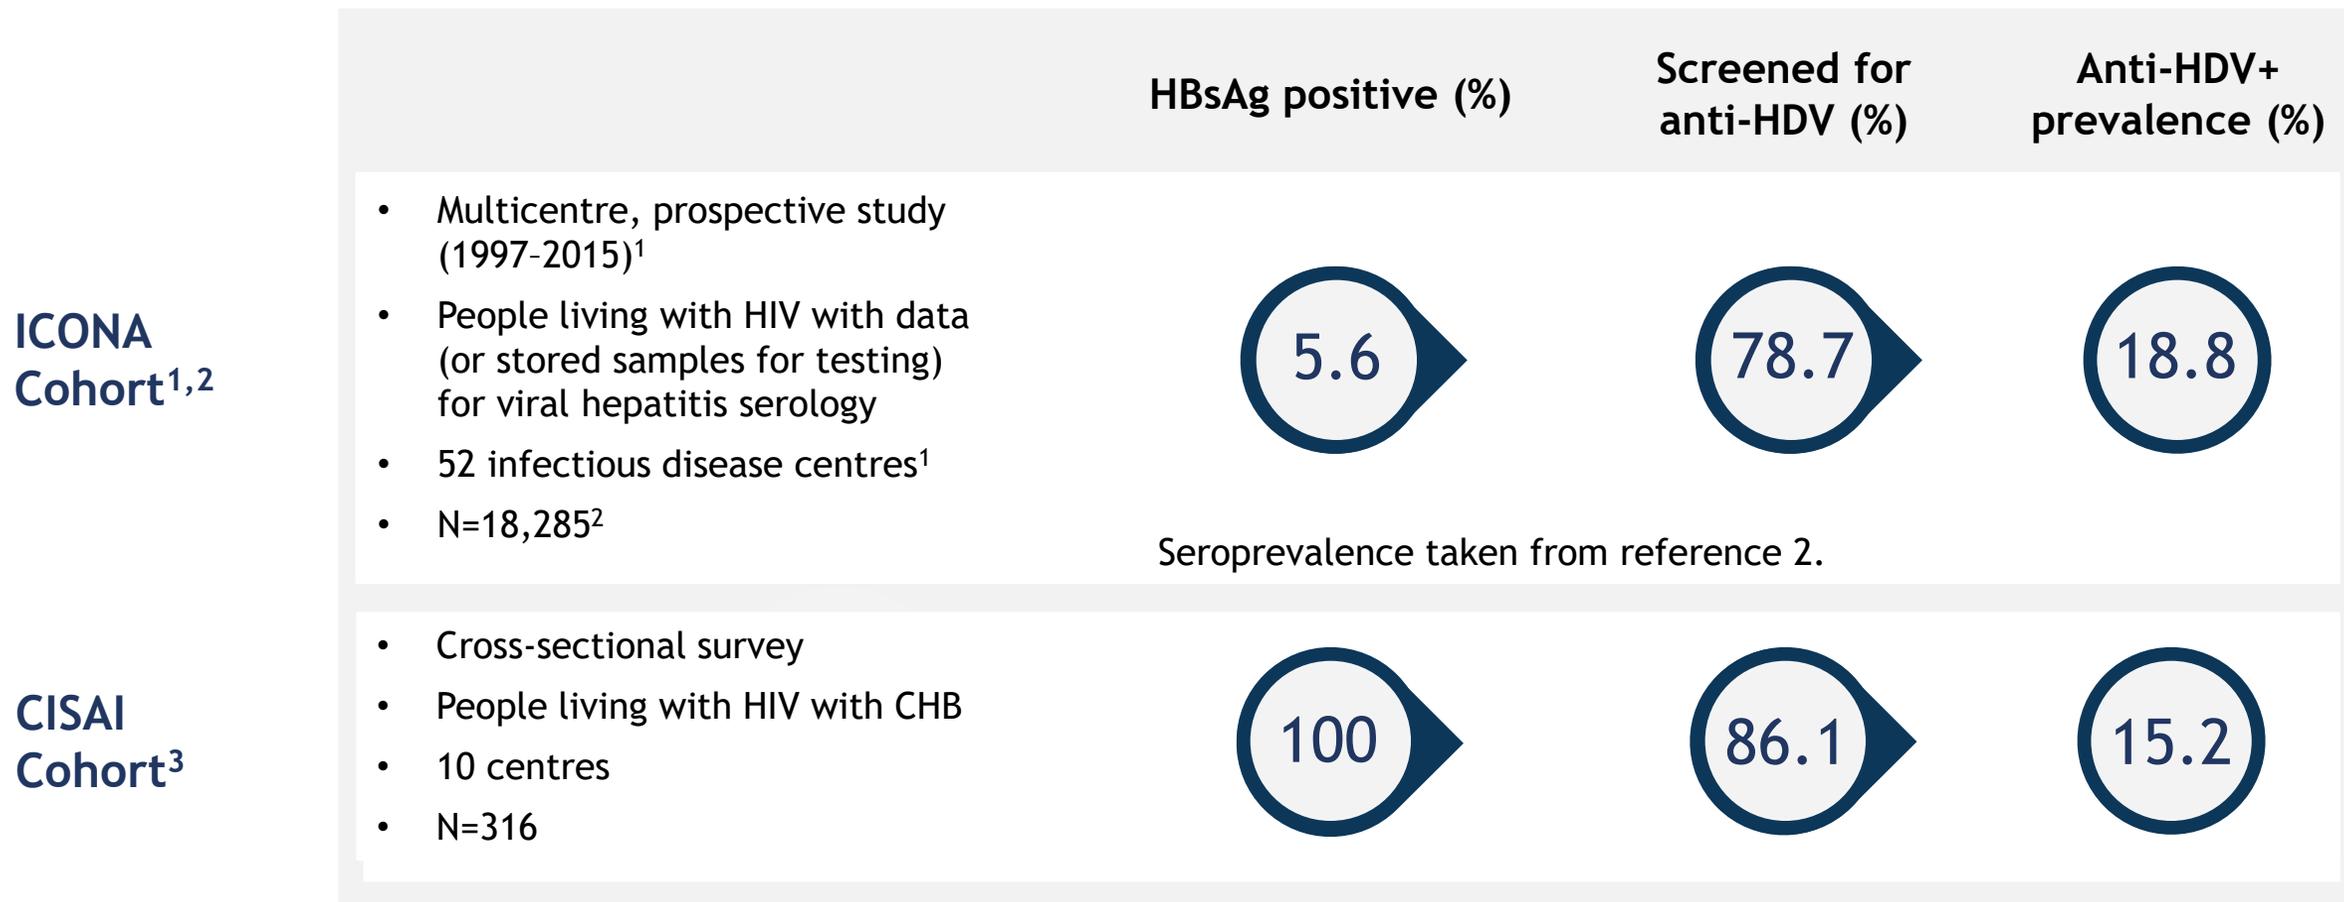

# Global viral hepatitis and HIV

Estimated number of individuals with viral hepatitis worldwide and coinfection with HIV

	All	PLWH
Total	8 billion	38 million
Hepatitis B <sup>31</sup>	262 million	5%–10% (2–4 million)
Hepatitis C <sup>32,43</sup>	57 million	5%–6% (2.3 million)
Hepatitis delta <sup>36,41</sup>	15–25 million	15% of HBsAg+ (350,000–700,000)

# HDV seroprevalence in people living with HIV in Italy

Prevalence estimates of hepatitis Delta in Italian cohorts of HIV-infected individuals (15.2-18.8%)<sup>2,3</sup> are higher than in non-HIV cohorts (8.3-9.8%)\*<sup>4,5</sup>

1. Brancaccio G, et al. Pathog Glob Health 2023;117:181-9; 2. Puoti M, et al. EASL 2023; WED-174; 3. Nicolini L, et al. Front Med 2023;10:3389; 4. Brancaccio G, et al. Int J Infect Dis 2023;129:266-273; 5. Kondili L, et al. EASL 2023; WED-146.

\*Not a head-to-head comparison  
HBsAg: hepatitis B surface antigen.

# Treatment considerations

- Spanish study: Long-term exposure to tenofovir significantly reduces serum HDV-RNA (apart from lowering HBV-DNA) in people with HIV/HDV. This virological benefit is coupled with significant improvements in liver fibrosis (Soriano V AIDS 2014)
- French and Swiss studies: patients with HIV/HBV/HDV on TDF followed up over 3 to 5 years did not experience a significant reduction in HDV viral load or change in clinical outcomes such as liver fibrosis (Boyd A AIDS Res Hum Retrovir 2023; Beguelin C CID 2017)

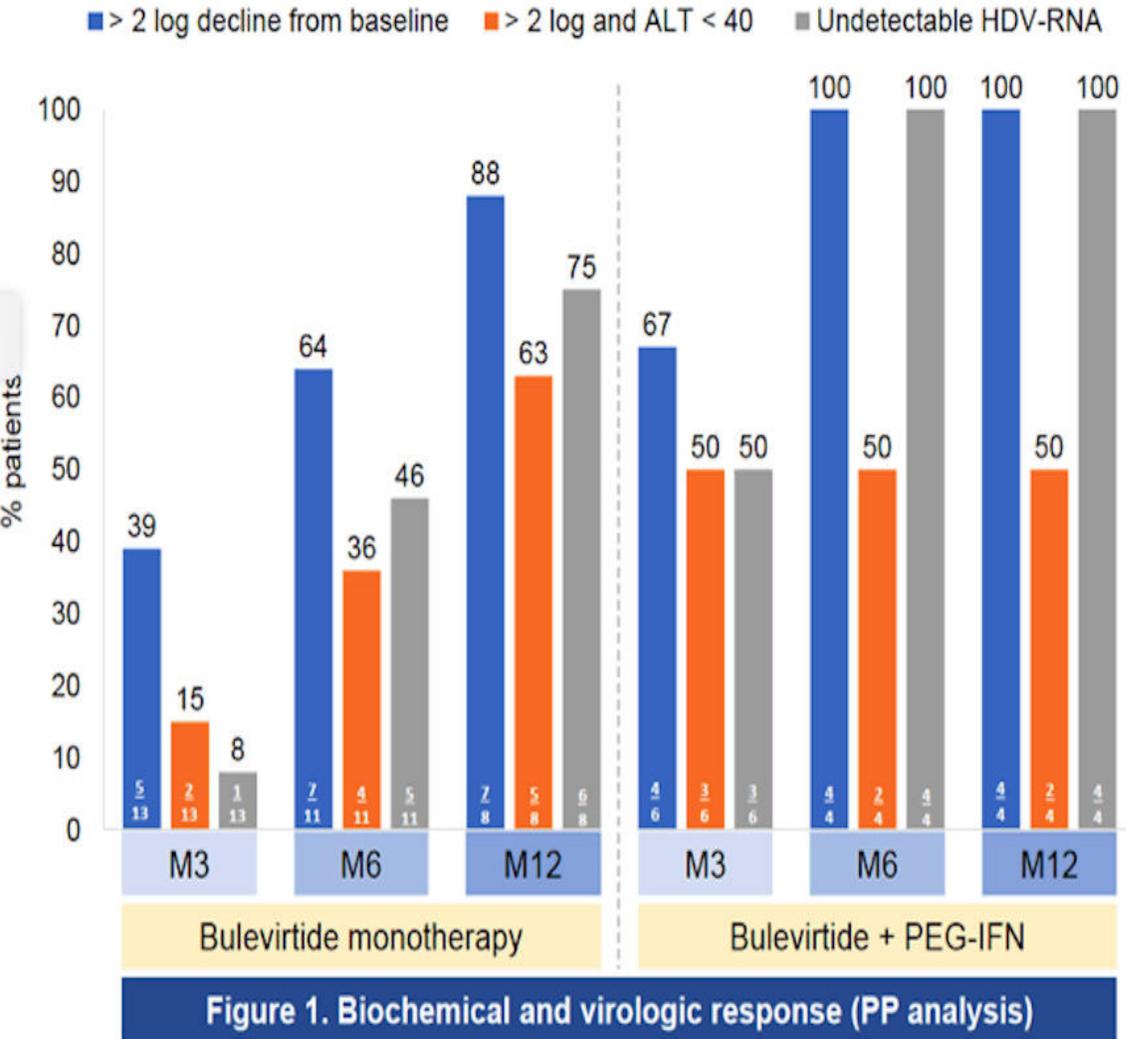

IFN- $\alpha$  has been used for treatment of HIV/HBV/HDV, but it is poorly tolerated and has low rates of long term effectiveness. Only 20% to 25% of patients achieved sustained virological response at 24 weeks after a 48-week treatment course, and out of all responders, half experienced late virological relapse (Abbas Z Antivir Ther 2014; Heidrich B Hepatology 2014)

# Novel Therapies in HBV/HDV

- **Lonafarnib** (an oral farnesyl transferase inhibitor that interfere with HDV virion assembly and release)
- **REP-2139** (a nuclear acid polymer that blocks the release of HBV suviral particles and clears circulating HBsAg)
- **PEG-IFN $\lambda$**   
the (a secreted cytokine that is genetically and structurally close to members of the IL-10 family of cytokines)
- **Bulivertide**

# BULEVIRTIDE +/- PEG-IFN IN HIV/HBV/HDV CO-INFECTED PATIENTS IN REAL-LIFE SETTINGS (#589)

## RESULTS

- Strong HDV antiviral and biochemical responses were observed in real-life independently of the BLV regimen administered
- In this first real-world cohort of HIV/HBV/HDV patients, daily administration of BLV 2 mg for 12 months was safe and well tolerated with no impact on CD4, HIV viral suppression or HIV treatment regimen

SHORT COMMUNICATION

**“Real world” efficacy of bulevirtide in HBV/HDV-related cirrhosis including people living with HIV: Results from the compassionate use programme at INMI Spallanzani in Rome, Italy**

**Prospective observational study**

Clinical evaluation, liver function tests, bile acid levels, HDV-RNA, HBV-DNA, hepatitis B surface antigen, and liver and spleen stiffness were assessed at baseline and after treatment months 1, 2, 3, 4, 6, 9, and 12. HIVRNA and CD4+/CD8+ count were assessed in people living with HIV.

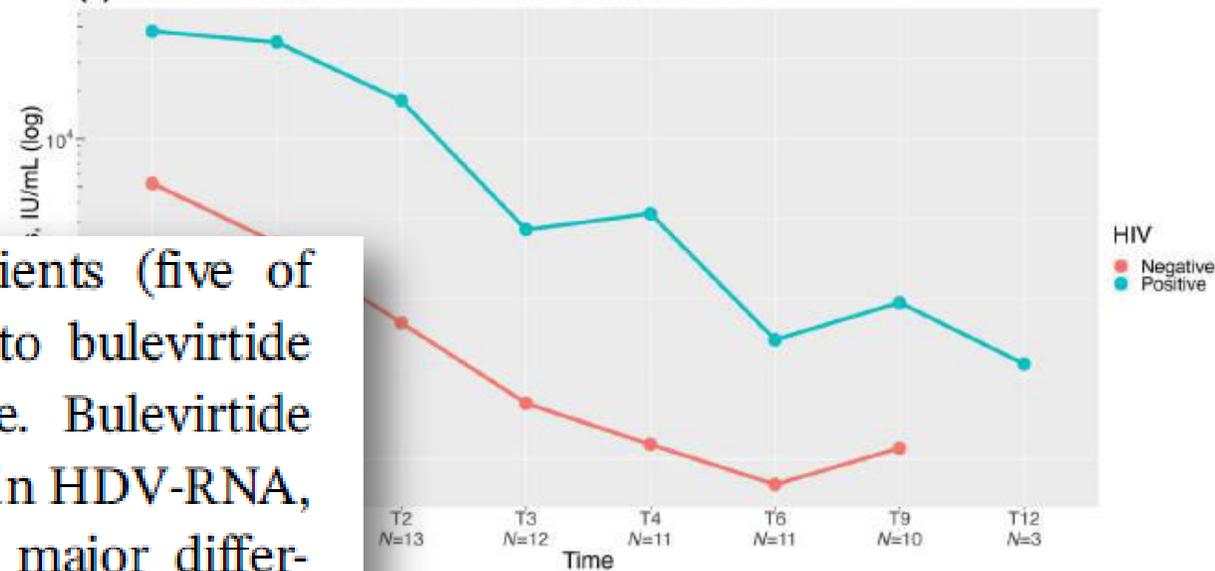

The first drug injection was administered under nurse supervision, and counselling was provided and adherence reviewed at each visit.

In conclusion, among 13 enrolled patients (five of whom were living with HIV), adherence to bulevirtide during the first 12 months was acceptable. Bulevirtide treatment resulted in a progressive decrease in HDV-RNA, liver enzymes, and liver stiffness, with no major differences based on HIV status. Bulevirtide treatment did not influence HIV suppression; thus, from a clinical point of view, no relevant drug–drug interactions were identified. Bulevirtide was generally well tolerated, and no treatment discontinuations due to drug toxicity were observed.

(a) Geometric means of HDV-RNA levels across time

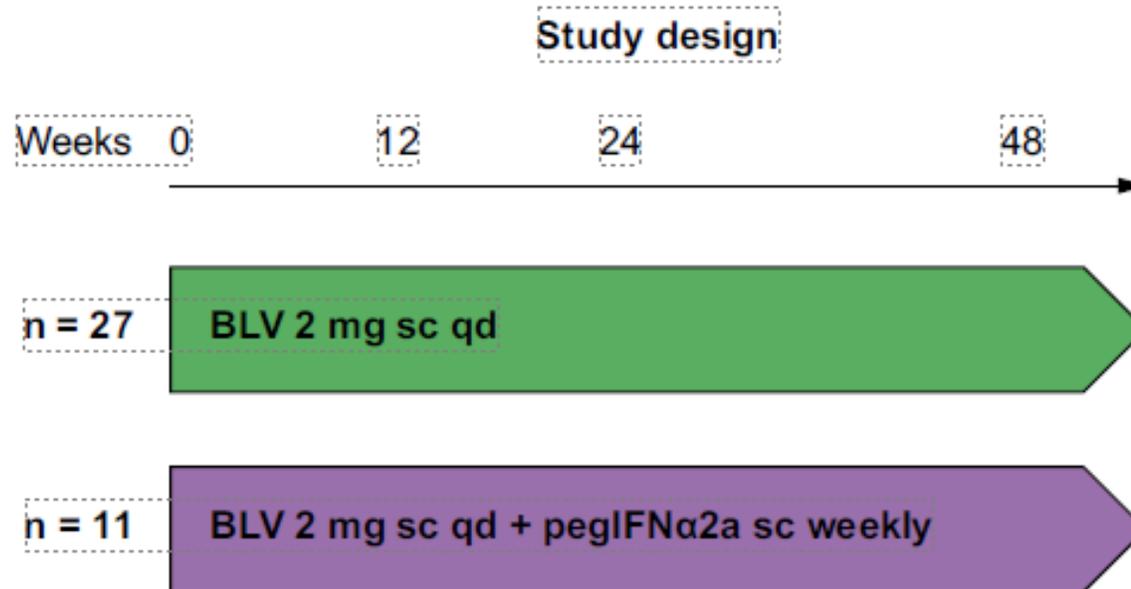

HDV-RNA, ALT, and liver stiffness

# Treatment with bulevirtide in HIV-infected patients with chronic hepatitis D: ANRS HD EP01 BuleDelta and compassionate cohort (Victor de Lédighen JHEP Reports 2024)

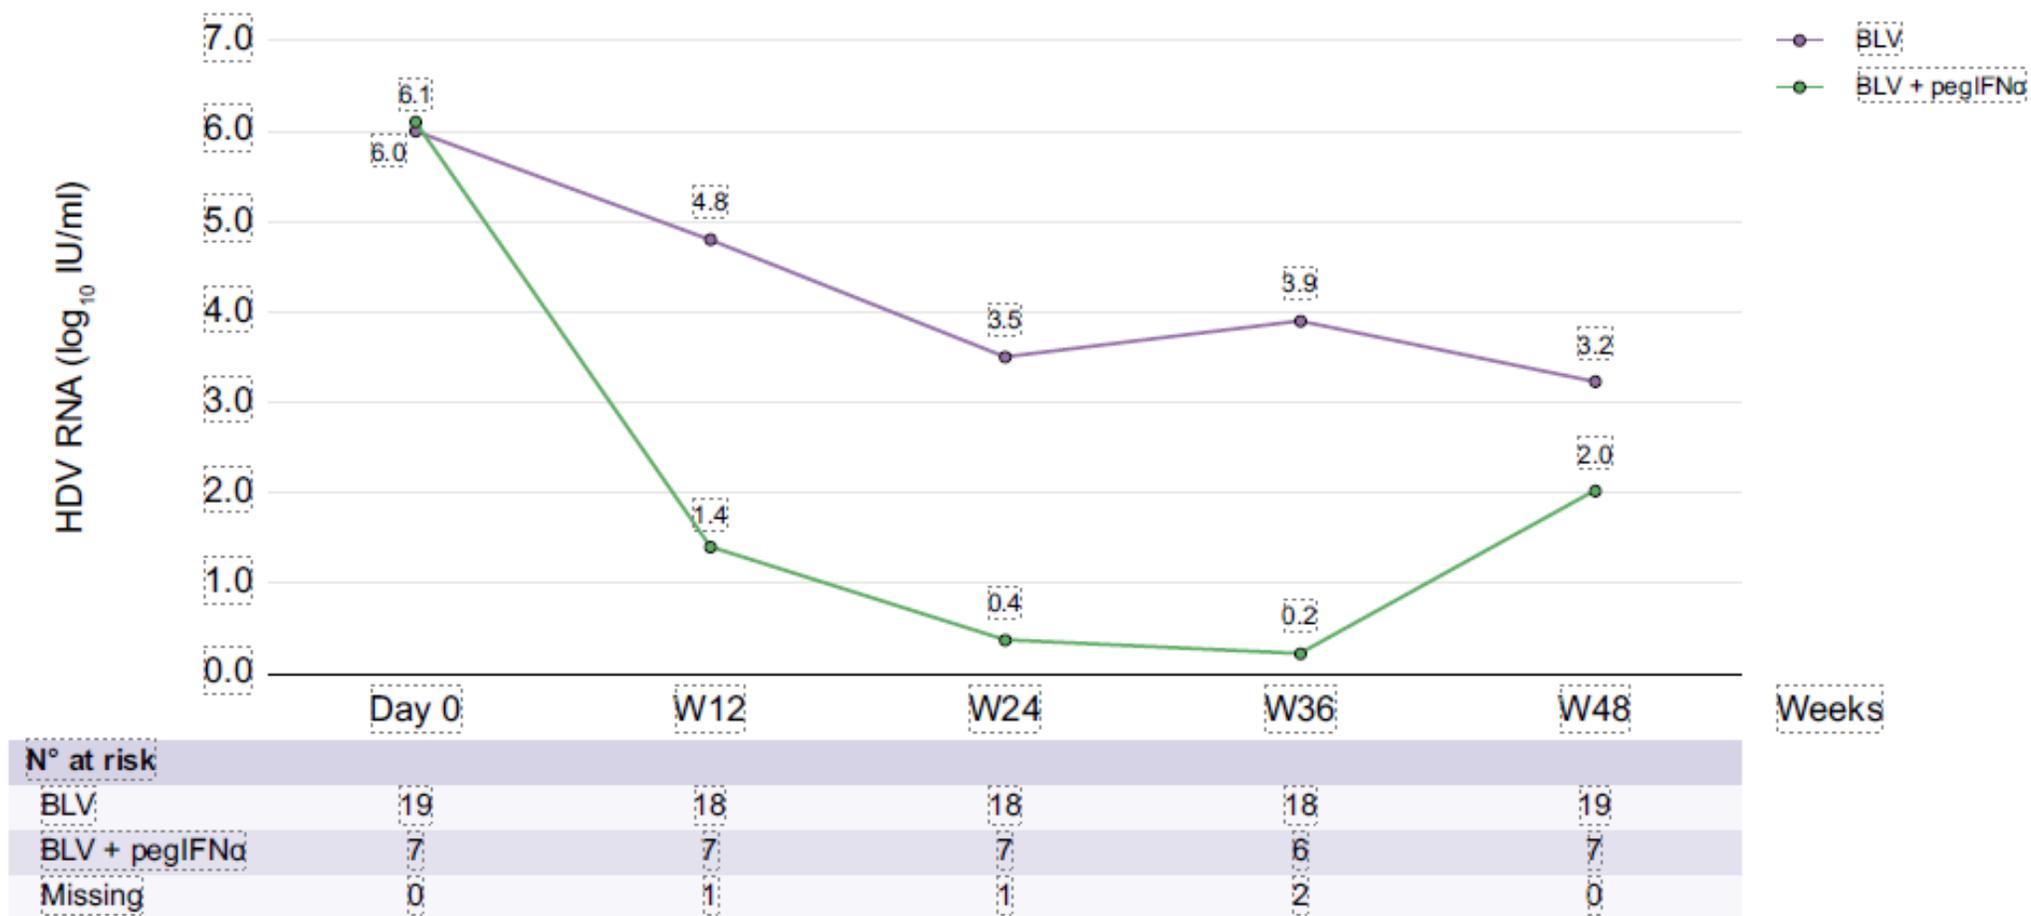

- ✓ Multicenter prospective and retrospective observational study
- ✓ Not a randomized study
- ✓ Therapy, duration and modifications were at the discretion of the physician

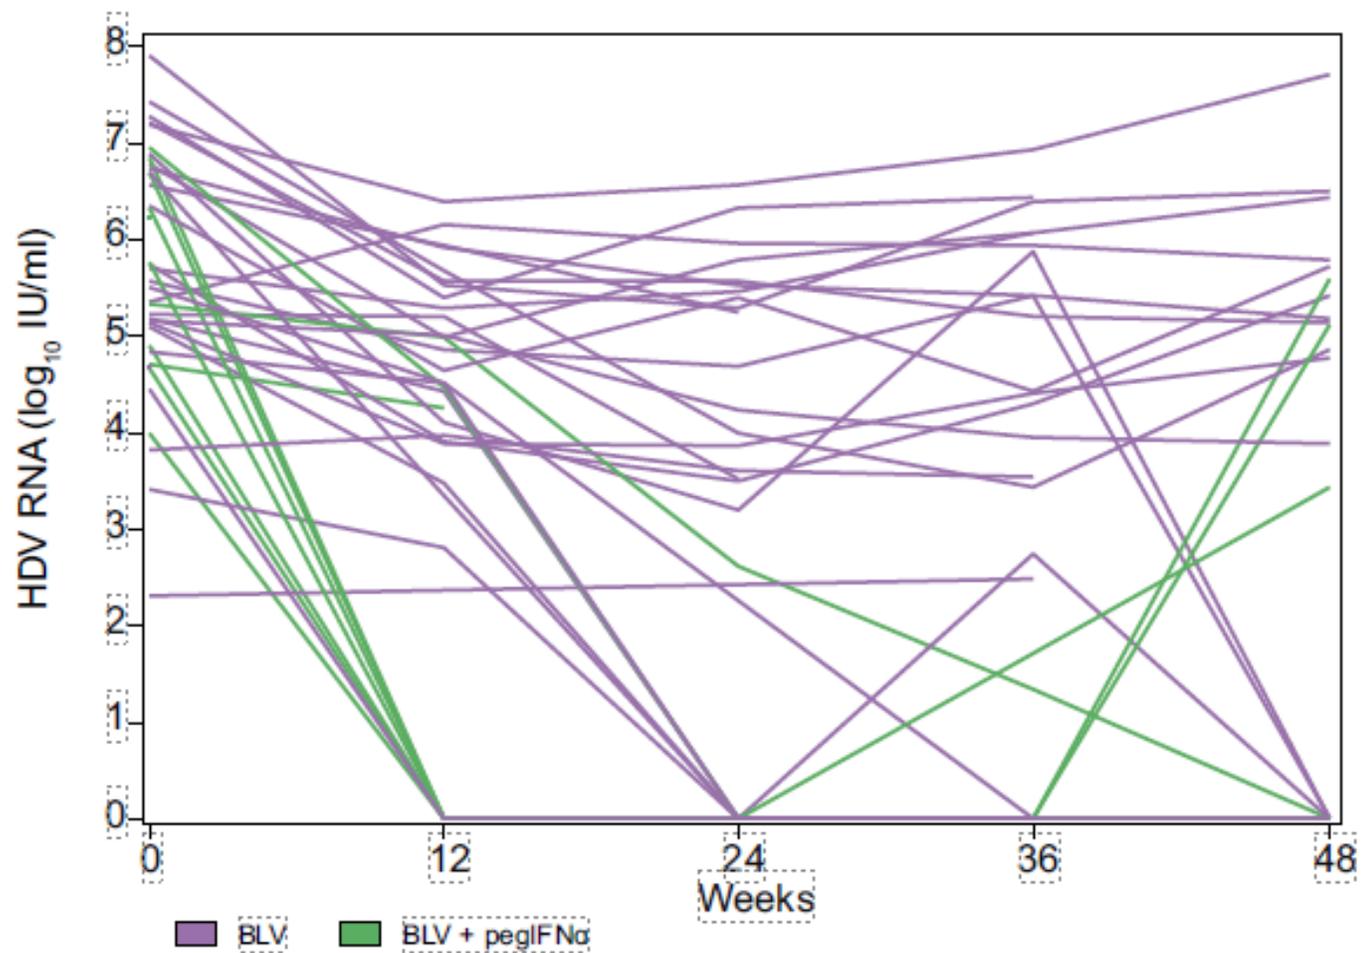

# Baseline Clinical Features

	All patients (N = 38)	BLV monotherapy (n = 27)	BLV + pegIFNα (N = 11)	p value
Age (years), mean ± SD	47.7 ± 8.6	47.7 ± 9.8	47.8 ± 5.1	0.9627

- No clinically significant interaction expected
- These drugs should not be co-administered
- Potential clinically significant interaction that is likely to require additional monitoring, alteration of drug dosage or timing of administration
- Potential interaction likely to be of weak intensity. Additional action/monitoring or dosage adjustment is unlikely to be required

## SAVE-D study Efficacy and safety of BLV monotherapy in HIV positive patients

24 HIV positive vs 220 HIV negative CHD patients

Last results  
from SAVE-D  
study

	Week 24			Week 48			Week 72			Week 96		
	HIV+	HIV-	p value									
<u>Virological Response</u>	36%	54%	0.10	59%	65%	0.60	73%	67%	0.69	80%	79%	0.94
<u>Biochemical Response</u>	45%	54%	0.47	65%	59%	0.63	69%	58%	0.42	100%	56%	<b>0.03</b>
<u>Combined Response</u>	18%	35%	0.11	41%	45%	0.78	45%	47%	0.97	80%	52%	0.22

**Virological response** :  $\geq 2$  log decline from baseline or HDV RNA TND/ $<$ LOD; **Biochemical response** : ALT  $<$ 40 U/L; **Combined response** : virological and biochemical response; comparisons were performed by Fischer exact tests

BLV monotherapy is effective and safe also in HIV coinfecting patients

# Conclusions

- Bulevirtide induces an on-treatment virological response in more than 50% of patients with HIV/HBV/HDV, suggesting that it should be considered as a first-line therapy in this population
- Treatment of hepatitis delta with bulevirtide in patients with HIV is safe, with no relevant drug–drug interactions
- Bulevirtide in combination with pegIFN $\alpha$  could be used in patients without pegIFN $\alpha$  contraindication
- The ideal duration of treatment and whether treatment may be curative in this population remains unknown

# HDV seroprevalence

## Globally

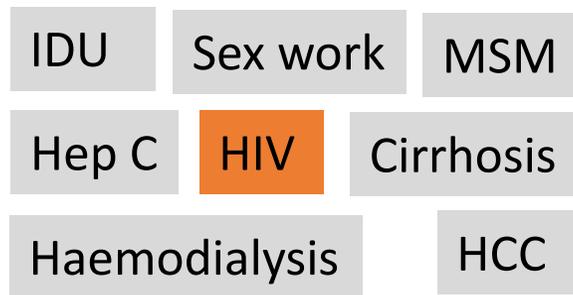

~5% in people with chronic HBV infection

~16% in people with HBV attending liver clinics

## Global burden 9-19 million

Highest prevalence in Mongolia, Moldova,  
Western and Middle Africa

### Factors associated with ↑ HDV seroprevalence

HIV associated with ↑  
HDV seroprevalence\*  
(pooled OR 6.6;  
95% CI 4.2, 10.6)

\*excluding settings with generalised HIV epidemics

## HDV seroprevalence in Europe (%) 1998-2018
